

ABSTRACT

A three position headpiece including a crown portion removably connected to a visor portion. The headpiece can be worn with the crown portion and visor portion connected by a concealed continuous fastening mechanism or the crown portion and the visor portion can be worn separately. The visor portion includes a hatband that conceals and provides a protective shield for the continuous fastening mechanism of the visor portion and crown portion. The hatband has an uninterrupted outer surface for advertisement or display. The junction between the visor portion and crown portion also forms a channel for the collection and controlled dissemination of fluids such as rainwater from the crown portion.
